ABSTRACT

A mopping trolley having a carriage, a mop press assembly with a discharge port, a clean receptacle for providing a source of clean liquid for mopping, and a waste receptacle for receiving waste liquid expressed from the mop press. The clean receptacle is located under the mop press so that a mop head may be dipped into the clean receptacle and lifted directly upward to the mop press, the mop head being maintained over the clean receptacle so that dripping excess fluid falls back to the clean receptacle below. In this way the amount of clean water wasted may be reduced, so that water dripping from the mop head falls back into the clean receptacle. The waste receptacle includes a portion that is positioned below the discharge port of the mop press assembly to receive waste liquid.
